

# Lecture 7

## October 11, 2023

# Substitution Ciphers

- Change characters in plaintext to produce ciphertext
- Example (Caesar cipher)
  - Plaintext is HELLO WORLD
  - Change each letter to the third letter following it (X goes to A, Y to B, Z to C)
    - Key is 3, usually written as letter 'D'
  - Ciphertext is KHOOR ZRUOG

# Attacking the Cipher

- Exhaustive search
  - If the key space is small enough, try all possible keys until you find the right one
  - Caesar cipher has 26 possible keys
- Statistical analysis
  - Compare to 1-gram model of English

# Statistical Attack

- Compute frequency of each letter in ciphertext:

G	0.1	H	0.1	K	0.1	O	0.3
R	0.2	U	0.1	Z	0.1		

- Apply 1-gram model of English
  - Frequency of characters (1-grams) in English is on next slide

# Character Frequencies

a	0.07984	h	0.06384	n	0.06876	t	0.09058
b	0.01511	i	0.07000	o	0.07691	u	0.02844
c	0.02504	j	0.00131	p	0.01741	v	0.01056
d	0.04260	k	0.00741	q	0.00107	w	0.02304
e	0.12452	l	0.03961	r	0.05912	x	0.00159
f	0.02262	m	0.02629	s	0.06333	y	0.02028
g	0.02013					z	0.00057

# Statistical Analysis

- $f(c)$  frequency of character  $c$  in ciphertext
- $\varphi(i)$  correlation of frequency of letters in ciphertext with corresponding letters in English, assuming key is  $i$ 
  - $\varphi(i) = \sum_{0 \leq c \leq 25} f(c)p(c - i)$  so here,  
$$\varphi(i) = 0.1 p(6 - i) + 0.1 p(7 - i) + 0.1 p(10 - i) + 0.3 p(14 - i) + 0.2 p(17 - i) + 0.1 p(20 - i) + 0.1 p(25 - i)$$
  - $p(x)$  is frequency of character  $x$  in English

# Correlation: $\varphi(i)$ for $0 \leq i \leq 25$

$i$	$\varphi(i)$	$i$	$\varphi(i)$	$i$	$\varphi(i)$	$i$	$\varphi(i)$
0	0.0469	7	0.0461	13	0.0505	19	0.0312
1	0.0393	8	0.0194	14	0.0561	20	0.0287
2	0.0396	9	0.0286	15	0.0215	21	0.0526
3	0.0586	10	0.0631	16	0.0306	22	0.0398
4	0.0259	11	0.0280	17	0.0386	23	0.0338
5	0.0165	12	0.0318	18	0.0317	24	0.0320
6	0.0676					25	0.0443

# The Result

- Most probable keys, based on  $\varphi$ :
  - $i = 6, \varphi(i) = 0.0676$ 
    - plaintext EBIIL TLOLA
  - $i = 10, \varphi(i) = 0.0631$ 
    - plaintext AXEEH PHKEW
  - $i = 14, \varphi(i) = 0.0561$ 
    - plaintext WTAAD LDGAS
  - $i = 3, \varphi(i) = 0.0586$ 
    - plaintext HELLO WORLD
- Only English phrase is for  $i = 3$ 
  - That's the key (3 or 'D')

# Caesar's Problem

- Key is too short
  - Can be found by exhaustive search
  - Statistical frequencies not concealed well
    - They look too much like regular English letters
- So make it longer
  - Multiple letters in key
  - Idea is to smooth the statistical frequencies to make cryptanalysis harder

# Vigenère Cipher

- Like Caesar cipher, but use a phrase
  - So it's effectively multiple Caesar ciphers
- Example
  - Message A LIMERICK PACKS LAUGHS ANATOMICAL
  - Key BENCH
  - Encipher using Caesar cipher for each letter:

key	BENCHBENCHBENCHBENCHBENCHBENCH
plain	ALIMERICKPACKSLAUGHSANATOMICAL
cipher	BPVOLSMPMWBGXUSBYTJZBRNVVNMPCS

# The Vigenère Tableau

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

Vigenère: rows are keys, columns are plaintext

message: HELLOWORLD

key: ECSECSECSE

cipher LGDPQOSTDH

Beaufort: left letters are plaintext; trace inwards until you find the key letter; the column is the plaintext

message: HELLOWORLD

key: ECSECSECSE

cipher XYHTOWQLHB

Variant Beaufort: left letters are keys; trace inwards until you find the plaintext letter; the column is the ciphertext

message: HELLOWORLD

key: ECSECSECSE

cipher DCTHMEKPTZ

# Relevant Parts of Tableau

A	B	C	E	H	N
C	D	E	G	J	P
E	F	G	I	L	R
G	H	I	K	N	T
H	I	J	L	O	U
I	J	K	M	P	V
K	L	M	O	R	X
L	M	N	P	S	Y
M	N	O	Q	T	Z
N	O	P	R	U	A
O	P	Q	S	V	B
P	Q	R	T	W	C
R	S	T	V	Y	E
S	T	U	W	Z	F
T	U	V	X	A	G
U	V	W	Y	B	H

- Tableau shown has relevant rows, columns only
  - Columns correspond to letters from the message
  - Rows correspond to letters from the message
- Example encipherments:
  - key R, letter B: ciphered letter is where row R and column B meet, giving “S”
  - Key L, letter H: ciphered letter is where row L and column H meet, giving “S”

# Useful Terms

- *period*: length of key
  - In earlier example, period is 3
- *tableau*: table used to encipher and decipher
  - Vigenère cipher has key letters on top, plaintext letters on the left
- *polyalphabetic*: the key has several different letters
  - Caesar cipher is monoalphabetic

# Attacking the Cipher

- Approach
  - Establish period; call it  $n$
  - Break message into  $n$  parts, each part being enciphered using the same key letter
  - Solve each part; you can leverage one part from another
- We will show each step

# The Target Cipher

- We want to break this cipher:

ADQYS MIUSB OXKKT MIBHK IZOOO EQOOG IFBAG KAUMF  
VVTAA CIDTW MOCIO EQOOG BMBFV ZGGWP CIEKQ HSNEW  
VECNE DLAAV RWKXS VNSVP HCEUT QOIOF MEGJS WTPCH  
AJMOC HIUIX

# Establish Period

- Kaskski: *repetitions in the ciphertext occur when characters of the key appear over the same characters in the plaintext*
- Example:

```
key      VIGVIGVIGVIGVIGV
plain    THEBOYHASTHEBALL
cipher   ÖPKWWĒCĪYÖPKWIRG
```

Note the key and plaintext line up over the repetitions (underlined). As distance between repetitions is 9 (dotted line), the period is a factor of 9 (that is, 1, 3, or 9)

# Repetitions in Example

Letters	Start	End	Gap Length	Gap Length Factors
OEQOOG	24	54	30	2, 3, 5
MOC	50	122	72	2, 2, 2, 3, 3

# Estimate of Period

- OEQOOG is probably not a coincidence
  - It's too long for that
  - Period may be 1, 2, 3, 5, 6, 10, 15, or 30
- MOC is also probably not a coincidence
  - Period may be 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, or 72
- Period of 2 or 3 is probably too short (but maybe not)
- Begin with period of 6

# Check on Period

- Index of coincidence is probability that two randomly chosen letters from ciphertext will be the same
- Tabulated for different periods:

1      0.0660

2      0.0520

3      0.0473

6      0.0427

# Compute IC for an Alphabet

- $IC = [n(n-1)]^{-1} \sum_{0 \leq i \leq 25} [F_i(F_i-1)]$ 
  - where  $n$  is length of ciphertext and  $F_i$  the number of times character  $i$  occurs in ciphertext
- For the given ciphertext,  $IC = 0.0433$ 
  - Indicates a key of length 5 or 6
  - A statistical measure, so it can be in error, but it agrees with the previous estimate (which was 6)

# Splitting Into Alphabets

alphabet 1: AIKHOIATTOBGEEERNEOSAI

alphabet 2: DUKKEFUAWEMGKWDWSUFWJU

alphabet 3: QSTIQBMAMQBWQVLKVTMTMI

alphabet 4: YBMZOAFCCOFPHEAXPQEPOX

alphabet 5: SOIOOGVICOVCSVASHOGCC

alphabet 6: MXBOGKVDIGZINNVVCIJHH

- ICs (#1, 0.0692; #2, 0.0779; #3, 0.0779; #4, 0.0562; #5, 0.1238; #6, 0.0429) indicate all alphabets have period 1, except #4 (between 1 and 2) and #6 (between 5 and 6); assume statistical variance

# Frequency Examination

#	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z
1	3	1	0	0	4	0	1	1	3	0	1	0	0	1	3	0	0	1	1	2	0	0	0	0	0	0
2	1	0	0	2	2	2	1	0	0	1	3	0	1	0	0	0	0	0	1	0	4	0	4	0	0	0
3	1	2	0	0	0	0	0	0	2	0	1	1	4	0	0	0	4	0	1	3	0	2	1	0	0	0
4	2	1	1	0	2	2	0	1	0	0	0	0	1	0	4	3	1	0	0	0	0	0	0	2	1	1
5	1	0	5	0	0	0	2	1	2	0	0	0	0	0	5	0	0	0	3	0	0	2	0	0	0	0
6	0	1	1	1	0	0	2	2	3	1	1	0	1	2	1	0	0	0	0	0	0	3	0	1	0	1
	H	M	M	M	H	M	M	H	H	M	M	M	M	H	H	M	L	H	H	H	M	L	L	L	L	L

The last row has general letter frequencies (H high, M medium, L low)

# Begin Decryption

- First matches characteristics of unshifted alphabet
- Third matches if I shifted to A
- Sixth matches if V shifted to A
- Substitute into ciphertext (bold are substitutions)

**ADIYS RIUKB OCKKL** MIGHK **AZOTO** EIOOL **IFTAG**  
**PAUEF VATAS CIITW EOCNO** EIOOL **BMTFV EGGOP**  
**CNEKI HSSEW NECSE DDAAA RWCXS ANSNP HHEUL**  
**QONOF EEGOS WLPCM AJEOC MIUAX**

# Look For Clues

- **AJE** in last line suggests “are”, meaning second alphabet maps A into S:

**ALIYS RICKB OCKSL MIGH S AZOTO MIOOL INTAG**  
**PACEF VATIS CIITE EOCNO MIOOL BUTFV EGOOP**  
**CNESI HSSEE NECSE LDAAA RECXS ANANP HHECL**  
**QONON EEGOS ELPCM AREOC MICAX**

# Next Alphabet

- **MICAX** in last line suggests “mical” (a common ending for an adjective), meaning fourth alphabet maps **O** into **A**:

**ALIMS RICKP OCKSL AIGHS ANOTO MICOL INTOG**  
**PACET VATIS QIITE ECCNO MICOL BUTTV EGOOD**  
**CNESI VSSEE NSCSE LDOAA RECLS ANAND HHECL**  
**EONON ESGOS ELDCM ARECC MICAL**

# Got It!

- $QI$  means that  $U$  maps into  $I$ , as  $Q$  is always followed by  $U$ :

**ALIME RICKP ACKSL AUGHS ANATO MICAL INTOS**  
**PACET HATIS QUITE ECONO MICAL BUTTH EGOOD**  
**ONESI VESEE NSOSE LDOMA RECLE ANAND THECL**  
**EANON ESSOS ELDOM ARECO MICAL**

# One-Time Pad

- A Vigenère cipher with a random key at least as long as the message
  - Provably unbreakable
  - Why? Look at ciphertext DXQR. Equally likely to correspond to plaintext DOIT (key AJIY) and to plaintext DONT (key AJDY) and any other 4 letters
- Warning: keys *must* be random, or you can attack the cipher by trying to regenerate the key
  - Approximations, such as using pseudorandom number generators to generate keys, are *not* random

# Overview of the DES

- A block cipher:
  - encrypts blocks of 64 bits using a 64 bit key
  - outputs 64 bits of ciphertext
- A product cipher
  - basic unit is the bit
  - performs both substitution and transposition (permutation) on the bits
- Cipher consists of 16 rounds (iterations) each with a 48 bit round key generated from the user-supplied key

# Structure of the DES

- Input is first permuted, then split into left half (L) and right half (R), each 32 bits
- Round begins; R and round key run through function  $f$ , then xor'ed with L
  - $f$  expands R to 48 bits, xors with round key, and then each 6 bits of this are run through S-boxes (substitution boxes), each of which gives 4 bits of output
  - Those 32 bits are permuted and this is the output of  $f$
- R and L swapped, ending the round
  - Swapping does not occur in the last round
- After last round, L and R combined, permuted, forming DES output

# Controversy

- Considered too weak
  - Diffie, Hellman said in a few years technology would allow DES to be broken in days
    - Design using 1999 technology published
- Design decisions not public
  - S-boxes may have backdoors

# Undesirable Properties

- 4 weak keys
  - They are their own inverses
- 12 semi-weak keys
  - Each has another semi-weak key as inverse
- Complementation property, where  $x'$  is the bitwise complement of  $x$
- is the bitwise complement of  $x$ 
  - $DES_k(m) = c \Rightarrow DES_k(m') = c'$
- S-boxes exhibit irregular properties
  - Distribution of odd, even numbers non-random
  - Outputs of fourth box depends on input to third box

# Differential Cryptanalysis

- A chosen ciphertext attack
  - Requires  $2^{47}$  plaintext, ciphertext pairs
- Revealed several properties
  - Small changes in S-boxes reduced the number of pairs needed
  - Making every bit of the round keys independent did not impede attack
- Linear cryptanalysis improves result
  - Requires  $2^{43}$  plaintext, ciphertext pairs
